

Ferro Glow™

VCI Tackle Box

- VCI inner protection
- glow in the dark lid

about your tackle box

The lid has been treated with state of the art luminous technology where the light excitable electrons exchange within its molecules. The excited particles have the ability to store light for up to 12 hours without recharging. Its properties could be best described as similar to moonlight, the emission will continue until all excitement levels have been released. It will be immediately recharged with exposure to light.

VCI protection

The inside of your tackle box has been especially treated with a rust preventative compound that to assist in the prevention of rust and corrosion of metal products. It is desirable to keep the lid closed as much as possible to maintain effective corrosion control. Under normal operating conditions rust prevention compounds will last for 3 years or more.
